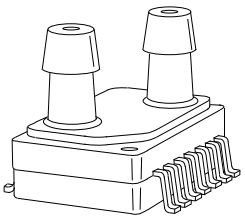
1. General

This document describes the specifications of the AL4 pressure sensors for gauge pressure type.



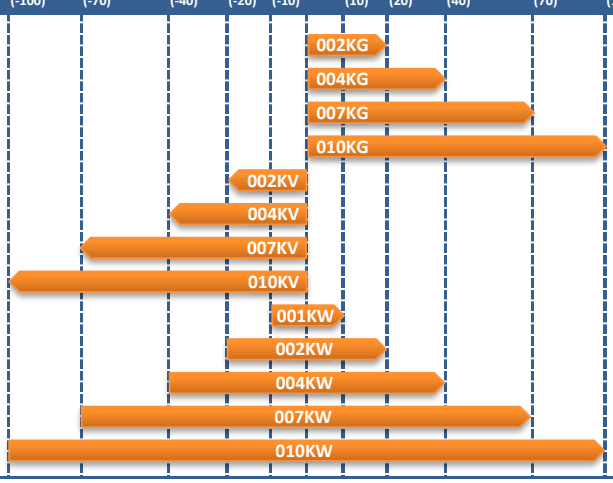
2. Principle

Fujikura Pressure Sensor is composed of a silicon piezo-resistive pressure sensing chip and a signal conditioning integrated circuit. The low-level signal from the sensing chip is amplified, temperature compensated, calibrated, and finally converted to digital data that is proportional to the applied pressure.

3. Device Lineup

This device has the following lineup.

Model	Pressure Type	Supply Voltage	Accuracy	Pressure Range
AL4	Gauge	5.0 Vdc 3.3 Vdc 3.0 Vdc	±1.5%FS	-10 (-100) to 10 kPa (100) cmH2O



Features

- ✓ Digital output
- ✓ Low pressure
- ✓ High proof pressure
- ✓ Moisture sensitivity level (MSL) 1
- ✓ Low power consumption
- ✓ High accuracy
- ✓ Modification available

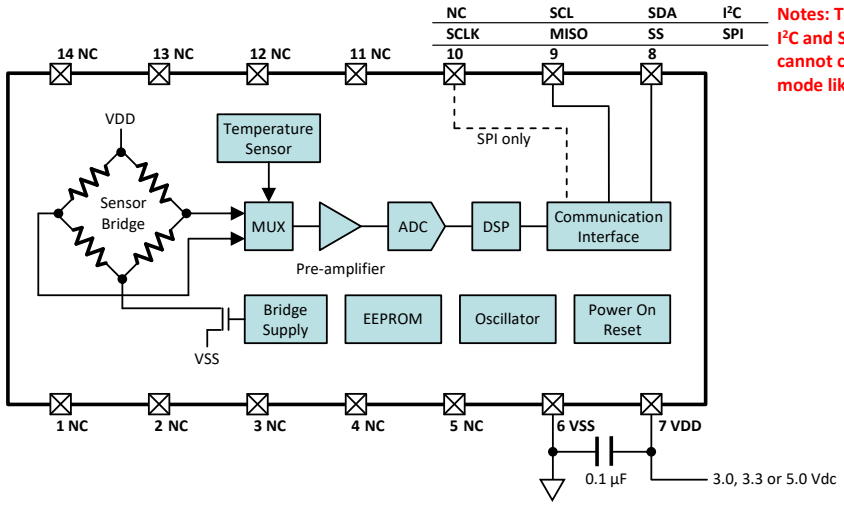
Applications

- ✓ Battery-operated devices
- ✓ Medical devices
- ✓ Industrial pneumatic devices
- ✓ Consumer devices

4. RoHS

This device is compliant with the Restriction of the use of certain Hazardous Substances in Electrical and Electronic Equipment (RoHS).

5. Block Diagram and Pin Connections



Notes: The internal connection of I²C and SPI is different. User cannot change communication mode like I²C to SPI or SPI to I²C.

Pin Assignment	Pin No.		Pin Name	I/O	Type	Function	
	1		NC	-	-	Non-connection	*3
	2		NC	-	-	Non-connection	*3
	3		NC	-	-	Non-connection	*3
	4		NC	-	-	Non-connection	*3
	5		NC	-	-	Non-connection	*3
	6		VSS	-	-	Common voltage connection	*1
	7		VDD	-	-	Power supply connection	*1
	8	I²C	SDA	I/O	Digital	Serial bidirectional data	*2
		SPI	SS	I	Digital	Slave select	
	9	I²C	SCL	I	Digital	Serial clock input	*2
		SPI	MISO	O	Digital	Master-In-Slave-Out	
	10	I²C	NC	-	-	Non-connection	*2
		SPI	SCLK	I	Digital	Serial clock input	
	11		NC	-	-	Non-connection	*3
	12		NC	-	-	Non-connection	*3
	13		NC	-	-	Non-connection	*3
	14		NC	-	-	Non-connection	*3

Notes:
*1) Put a 0.1µF capacitor between VDD Pin 7 and VSS.
*2) I²C or SPI is factory setting. User cannot change communication mode.
*3) NC pins must be open.

6. Device Name Code

The device name code is consisted of Sensor code, Pressure code, Slave address code and Packing style. For the exact ordering device number, please refer to Chapter 22 Ordering Information.

Note:

*1) The device is calibrated based on the unit of "kPa". Other converted pressure values are for reference.

7. Absolute Maximum Ratings

Item	Condition	Symbol	Rating		Unit
			Min.	Max.	
Supply Voltage		VDD_{max}	-0.3	6	Vdc
Voltage at Digital I/O pins		V_{diomax}	-0.3	VDD+0.3	Vdc
Operating Temperature		T_{opt}	-40	+85	°C
Storage Temperature		T_{stg}	-40	+85	°C

Notes:

*1) Absolute maximum ratings are the limits that the device will withstand without damage.

8. Environmental Specifications

Item	Condition	Symbol	Rating			Unit	
			Min.	Typ.	Max.		
Operating Humidity	Non-condensing, +65°C		-	-	95	%RH	*1, 2
Storage Humidity	Non-condensing, +65°C		-	-	95	%RH	*1, 2

Notes:

*1) Do not wet the device with dew.

*2) If the device is operated or storage at above +65°C in 95%RH, accuracy of the output is subject to be out of the specifications.

9. Pressure Specifications

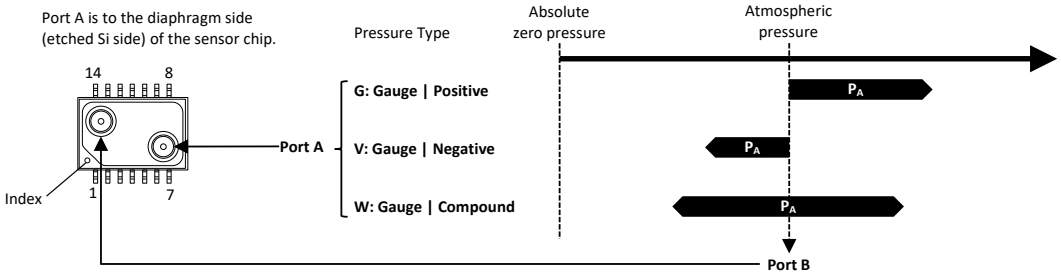
Type of Pressure	Gauge pressure	*1
Pressure Media	Non-corrosive gases for wetted materials	*2, 3

Notes:

*1) gauge pressure is defined as the difference between the pressure applied to Port A and atmospheric pressure applied to Port B. See below figure.

*2) Wetted materials are PPS resin, silicone resin, silicon, gold, Cu alloy and silver.

*3) Ensure the pressure media contains no particulates. The device is not compatible with liquids.



Pressure Table

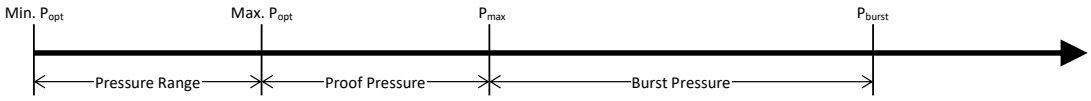
Pressure Code \ Item / Symbol	Pressure Range *1		Proof Pressure *2	Burst Pressure *3	Unit
	Min. P_{opt}	Max. P_{opt}	P_{max}	P_{burst}	
002KG	0	+2	+100	+100	kPa
004KG	0	+4	+100	+100	kPa
007KG	0	+7	+100	+100	kPa
010KG	0	+10	+100	+100	kPa
002KV	-2	0	+100	+100	kPa
004KV	-4	0	+100	+100	kPa
007KV	-7	0	+100	+100	kPa
010KV	-10	0	+100	+100	kPa
001KW	-1	+1	+100	+100	kPa
002KW	-2	+2	+100	+100	kPa
004KW	-4	+4	+100	+100	kPa
007KW	-7	+7	+100	+100	kPa
010KW	-10	+10	+100	+100	kPa

Notes:

*1) In Pressure Range(P_{opt}), the output is proportional to difference between the pressure applied to Port A and Port B, meeting the specified accuracy.

*2) Proof Pressure(P_{max}) is defined as maximum applied pressure to the device without damage.

*3) The device will be damaged, if applied pressure is beyond Burst Pressure(P_{burst}).



Pressure Port Connection

Recommended Tube (Reference)

Flexible tubing is recommended. The following tubing is for reference. Please select appropriate tubing considering material, Durometer hardness and maximum pressure. Manifold connection can also be available with O-ring or sealing fixtures.

Unit	I.D.	O.D.	Wall thickness
inch	3/32	7/32	1/16
mm	2	4	1

Manifold Connection (Reference)

Manifold connection can also be available with O-ring or sealing fixtures. There are parting lines on the surface of the pressure port at the base side. Top part of the pressure port (barbed part) is recommended for sealing with fixtures.

		+65°C		-	1177	-		
Dielectric Strength				-	-	1	mA	*14
Insulation Resistance				100	-	-	MΩ	*15

Notes:

*1) Supply voltage (VDD) should be constant.

*2) Offset pressure data (D_{off}) is defined as the pressure data at minimum P_{opt}. In case of Pressure type V, Offset pressure data (D_{off}) is defined as the pressure data of maximum P_{opt}.

*3) Offset error is calibration error of Offset pressure data (D_{off}) at production. It does not include Long term offset drift. It would be suggested that applications have Auto-zeroing function.

*4) Full scale pressure data (D_{fs}) is defined as the pressure data at maximum P_{opt}. In case of Pressure type V, Full scale pressure data (D_{fs}) is defined as the pressure data of minimum P_{opt}.

*5) Span pressure data (SD) is defined as the pressure data difference between Offset pressure data (D_{off}) and Full scale pressure data (D_{fs}).

*6) The unit of Accuracy "%FS" is defined as a percent error by Span pressure data (SD).

*7) Accuracy (Error) is the specs of out-going inspection at Fujikura. It consists of the following:
- Non-linearity
- Temperature errors over the temperature range -5 to 65°C
- Pressure hysteresis
- Calibration errors of sensitivity and offset

*8) The following errors are NOT included to Accuracy (Error):
- Offset change due to port orientation sensitivity, soldering thermal stress and assembling mechanical stress
- Offset drift over time

*9) Please also refer to Chapter 18 Transfer Function.

*10) Lower power mode is available for a modification product. Please ask Fujikura.

*11) Initializing process starts when VDD reached 2.7 V. After initializing process, ready to data read. See the figure below.

*12) Response time (t_r) is defined as the time for the change in the pressure data from 10 % to 90 % or from 90 % to10 % of its final value when the input pressure makes a step change. Please see the figure below.

*13) Temperature Data (D_{tmp}) is for reference.

*14) Dielectric strength is defined as the leakage current between all pins and the package with AC 500 V, 1 minute.

*15) Insulation resistance is defined as the resistance value between all pins and the package with DC 500 V.

11. Electrical Characteristics for I²C or SPI Interface

Communication interface (communication mode) of I²C or SPI is factory setting. User cannot change communication mode like from I²C to SPI or from SPI to I²C.

Pull-up Resistor	Pin8 SDA, Pin9 SCL	Rpu	1	-	-	kΩ	
Slave address	7 bit, Factory setting		0x28 to 0x78				*3

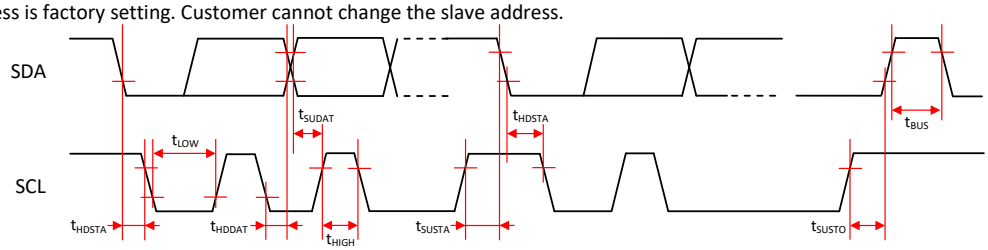
Notes:

*1) There are three differences in this device protocol compared with the original I²C™ protocol:
- Sending a start-stop condition without any transitions on the CLK line (no clock pulses in between) creates a communication error for the next communication, even if the next start condition is correct and the clock pulse is applied. An additional start condition must be sent, which results in restoration of proper communication.
- The restart condition - a falling SDA edge during data transmission when the CLK clock line is still high - creates the same situation. The next communication fails, and an additional start condition must be sent for correct communication.
- A falling SDA edge is not allowed between the start condition and the first rising SCL edge. If using an I2C™ address with the first bit 0, SDA must be held low from the start condition through the first bit.

*2) Combined low and high widths must equal or exceed minimum SCLK period.

*3) Slave address is factory setting. Customer cannot change the slave address.

Timing Diagram



14. I²C Communication Protocol

Item		Measurement Packet	
Data Fetch			
Status bits	00	Normal operation , good data packet	
	01	Device in Command Mode	*1
	10	Stale data: Data has aleady been feched since the last measurement cycle.	*2
	11	EEPROM Error	*3

Notes:

*1) If the status bits are 01, the device must be re-started to turn power supply off and on again.

*2) If a data fetch is performed before or during the first measurement after power-on reset, then “stale” will be returned, but this data is actually invalid because the first measurement has not been completed.

*3) If the status bits are 11, do not use the device anymore.

15. SPI Digital Interface

This mode is half duplex (read-only).

Item	Condition	Symbol	Rating			Unit	
			Min.	Typ.	Max.		
SCLK clock frequency	4 MHz clock	f_{SCL}	50	-	800	kHz

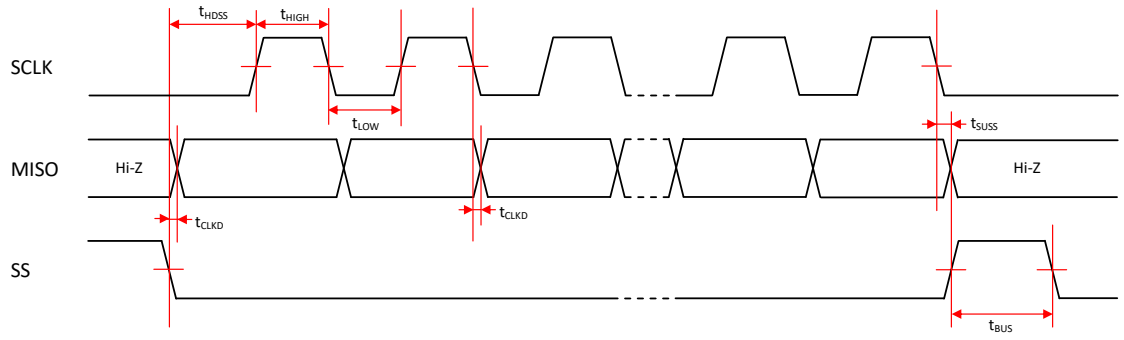
Minimum SCLK clock high width		t_{HIGH}	0.6	-	-	µsec.	*1
Clock edge to data transition		t_{CLKD}	0	-	0.1	µsec.	
Rise of SS relative to last clock edge		t_{SUSS}	0.1	-	-	µsec.	
Buss free time between rise and fall of SS		t_{BUS}	2	-	-	µsec.	

Notes:

*1) Combined low and high widths must equal or exceed minimum SCLK period.

Timing Diagram



16. SPI Communication Protocol

The master should sample MISO on the rise of SCLK.

Item	Measurement Packet
Data Fetch	 Packet = [{S(1:0),B(13:8)},{B(7:0)},{T(10:3)},{T(2:0),xxxxx}] Where S(1:0) = Status bits of packet (Normal, Command, Busy, EEPROM Error) B(13:8) = Upper 6 bits of 14-bit bridge data B(7:0) = Lower 8 bits of 14-bit bridge data T(10:3) = Corrected temperature data (if application does not require corrected temperature data, terminate read only.) T(2:0),xxxxx = Remaining bits of corrected temperature data for full 11-bit resolution Hi-Z = High impedance

20. Soldering

Items	Condition	
Moisture Sensitivity Level	Level 1	*1
Reflow Soldering Profile		*2 *3 *4 *5

A	Ramp up	2 to 4°C / sec.
B	Pre-heating	150 to 180°C 60 to 120 sec.
C	Ramp up	2 to 4°C / sec.
D	Heating	Above 230°C, 45 sec. max. 245°C max., 10 sec. max.
E	Ramp down	2 to 4°C / sec.

Notes:
*1) This device is classified as moisture sensitivity level (MSL) 1 that is defined in Jedec standard J-STD-20. Floor life time is unlimited. However, the plating of pins is silver (Ag) that could be discolored to black or brown by sulfur in the environment. Discoloration of pins could impact soldering reliability. The device should be sealed in the embossed carrier tape before soldering.
*2) NEVER wash the device with any washing liquid. NEVER wash the device with any ultrasonic washing machine.
*3) Do not put the solder and flux on the device's package.
*4) Temperature means Surface temperature of the device's package.
*5) Do not reflow more than twice.

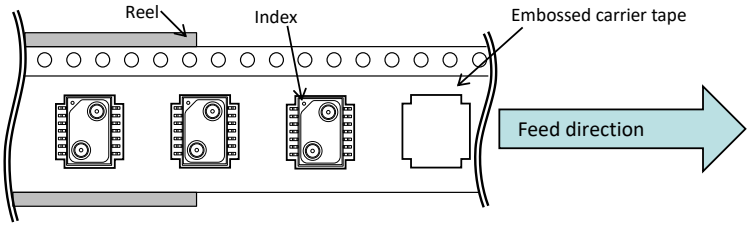
23. Tape & Reel Information



24. Handling Notes

Plating of pins is silver (Ag). Silver has physical property that is discolored to black or brown by sulfur. There are notes for handling as below:

- To prevent discoloration of pins, please keep the devices sealed in static shielding bags before soldering.
- Do not solder the devices that have discolored pins.
- After soldering, pins would be discolored in black or brown in atmosphere. However it does not impact reliability of the device.
