USER GUIDE  
UnitedSiC\_UG0001 - April 2022

# UnitedSiC SiC FET User Guide

By Mike Zhu

## Introduction

This SiC FET user guide presents practical solutions and guidelines for using RC snubbers with fast switching SiC devices. The solution is verified by experimental double pulse tests (DPT) results. The snubber loss is precisely measured to assist users in computing the power rating of the snubber resistor. The beneficial impact of the snubber is analyzed for both hard-switching and soft-switching applications in [UnitedSiC AN0018 "Switching Fast SiC FETs with a Snubber"](#). Please review our webinar for more details: [Minimizing EMI and switching loss for fast SiC FETs](#)

Mike Zhu is an Application Engineer at United Silicon Carbide. Experience includes design of power electronics, EMI mitigation, power device evaluation.

Learn more about power electronic applications at <https://unitedsic.com/application-notes/>

(a) Hard-switching snubber configuration

(b) Soft-switching snubber configuration

Figure 1. DPT schematic with RC snubbers on both switches for hard-switching (a) and soft-switching (b)

A double pulse tester (DPT) has a half-bridge structure with an inductive load. A simplified schematic is shown in Figure 1. "DPT schematic with RC snubbers on both switches for hard switching (a) and soft switching (b)". When the device under test (DUT) is turning on/off, the bypass capacitor  $C_d$  provides transient energy to commutate the high side (HS) and low side (LS) devices. This is the transient power loop. The bypass capacitor should be designed close to the half-bridge layout to reduce the parasitic inductance in the transient power loop. For DUT turn-on transient, once commutation is finished steady-state current flows from the DC LINK capacitors to charge the load inductor  $L$  and returns to DC LINK bulk capacitor through the DUT. This is the steady-state power loop. When the DUT is off, the diode becomes forward biased, and the inductor current circulates through the diode and inductor (the freewheeling loop). To avoid high  $dv/dt$  induced turn-on for fast SiC devices, an isolated gate driver and isolated power supplies are used to suppress high  $dv/dt$  induced common-mode noise in the gate signal path. Two snubber scenarios are provided here. For more details, please refer to the snubber application note UnitedSiC\_AN0018 at [https://unitedsic.com/appnotes/Snubber%20AppNotes\\_V8.pdf](https://unitedsic.com/appnotes/Snubber%20AppNotes_V8.pdf).

When designing a bus snubber  $R_d$ , designers should pay attention to total energy dissipation in  $R_d$  to avoid overheating.

Notes for Gen 3 products in hard-switching half-bridge applications:

1. UF3CxxxxxyK4S gives the highest efficiency. Snubber is recommended to improve EMI.
2. UF3CxxxxxyK3S with snubber is a fast solution for 3L applications. UF series in 3 terminal packages **MUST** use a snubber for hard-switching.

Notes for Gen 3 products in soft-switching half-bridge applications (LLC, PSFB, etc.):

3. DFN8x8, D2PAK-7L, TO247-4L has highest efficiency with snubber capacitors (No Rs)
4. UJ3CxxxxxyK3S does not require snubber. For RDS(on) >80m, UJ3CxxxxxyK3S show good balance of EMI & efficiency.
5. A bus snubber with a Cds capacitor generally provides the best performance and waveforms

\*The frequency mentioned in Application type is a general recommendation. The actual usable frequency should be calculated and verified by loss and thermal calculation. Please visit our online [FET JET Calculator](#) for more information.

Notes for Gen 4 products in hard-switching half-bridge applications:

1. All UJ4C devices are measured with a 2.5Ω, 100nF Bus snubber
2. All UJ4CxxxK3S devices requires either a 2.5Ω, 100nF Bus snubber or a recommended device snubber.
3. For switching currents above 20A per device, a device snubber is required. A bus snubber with a pure capacitive snubber is also an option but results in higher overshoot across device drain-to-source.

\*The frequency mentioned in Application type is a general recommendation. The actual usable frequency should be calculated and verified by loss and thermal calculation. Please visit our online [FETJET Calculator](#) for more information.

Figure 2: Long Lead vs. Short Lead - through-hole devices must have leads fully inserted to minimize inductance

## Snubber Design Guidelines

This SiC FET user guide presents practical solutions and guidelines for using RC snubbers with fast switching SiC devices. The solution is verified by experimental double pulse tests (DPT) results. The snubber loss is precisely measured to assist users in computing the power rating of the snubber resistor. The beneficial impact of the snubber is analyzed for both hard switching and soft switching applications. An application note entitled "Switching fast SiC FETs with a snubber" complements this user guide and can be found at [https://unitedsic.com/wp-content/uploads/2019/11/Snubber-AppNotes\\_V8.pdf](https://unitedsic.com/wp-content/uploads/2019/11/Snubber-AppNotes_V8.pdf).

More snubber guidance is available at: <https://info.unitedsic.com/fet-design-tips>

### Basic assumptions:

1.  $R_{gon}$ : minimize  $Q_{rr}$  to reduce  $E_{on}$ .
2.  $R_{goff}$ : Small value gives better VGS waveform. UFK3S needs higher  $R_{goff}$  to avoid oscillation. 0 is possible.
3. Cascode  $R_g$  has big impact on turn on  $di/dt$  while limited effect on  $dv/dt$ .
4.  $dv/dt$  is affected by snubber.

### Guidelines:

Snubber Rule	UF3CxxxxyyK3S	UF3CxxxxyyK4S
$C_s (>80m R_{DS(on)})$	3xCoss(er)	2xCoss(er)
$C_s (<30m R_{DS(on)})$		Coss(er)
$R_s (\Omega)$	See datasheet	See datasheet

**Note:** Using snubber  $C_s$  can greatly reduce  $E_{off}$  for soft switching (ZVS) applications.

### BOM:

$C_s$ (pF)	Series	Part Number	Package	Rated V
47	COG	202R18N470JV4E	1206	2000V
68		C1206C680JGGAC7800	1206	
100		202R18N101JV4E	1206	

Cs (pF)	Series	Part Number	Package	Rated V
150	COG	C1206C151JGGAC7800	1206	2000V
220		C1206C221JGGAC7800	1206	
330		C1210C331JGGACTU	1210	
680		C1808C681JGGAC7800	1808	

**Notes:**

- "COG" ceramic capacitors have most stable capacitance over temperature and voltage variation.
- [KEMET's X8G HV Class 1](#) dielectric features a 150°C maximum operating temperature, offering the latest in high temperature dielectric technology and reliability for extreme temperature applications and under the hood applications. X8G exhibits no change in capacitance with respect to voltage and boasts a minimal change in capacitance with reference to ambient temperature. It is a suitable replacement for higher capacitance and larger footprint devices that fail to offer capacitance stability. Capacitance change is limited to  $\pm 30\text{ppm}/^\circ\text{C}$  from  $-55^\circ\text{C}$  to  $+150^\circ\text{C}$ . KEMET X8R is available with flexible termination technology which inhibits the transfer of board stress to the rigid ceramic body, therefore mitigating flex cracks which can result in low IR or short circuit failures.

Rs ( $\Omega$ )	Power Rating (W)	Part Number	Package
4.7	0.5	CRCW08054R70FKEAHP	0805
	0.75	CRCW12104R70JNEAHP	1210
	1	CRCW20104R70JNEFHP	2010
	1.5	CRCW25124R70JNEGHP	2512
10	0.5	CRCW080510R0JNEAHP	0805
	0.75	CRCW120610R0JNEAHP	1206
	1	CRCW201010R0JNEFHP	2010
	1.5	CRCW251210R0JNEGHP	2512

**Notes:**

- VISHAY "CRCW-HP e3" series provides excellent pulse load capability and AEC-Q200 qualified.
- One of the main benefits of the CRCW-HP resistor is the power dissipation which is much higher than power dissipated from standard chip resistor of the same size. For example, a standard 1206 size thick film resistor is rated at 0.25W while CRCW1206-HP is rated at 0.75W (three times more). This is mainly achieved by the double-sided printed design. CRCW0805-HP, for instance, is rated at 0.5W, the same power rating as standard 1210 while occupying much less area on the PCB, so there is a significant PCB space that can be saved. This is one of the reasons why the HP series is recommended for densely populated PCBs. The biggest case size of the CRCW-HP series is 2512, rated at 1.5 W. Additionally, CRCW-HP OR Jumper offers much higher maximum current capability in the same package size as a standard OR jumper.

- TE Connectivity offers 3540 series of SMD resistors that can handle 4W at 70°C in 2817 size package.
